I. ADMINISTRATIVE INFORMATION

Completion Date of Approved Jurisdictional Determination (AJD): 8/14/2020
ORM Number: SPA-2020-00216-LCO (TXDOT- Culvert 64 Jurisdictional Determination)
Associated JDs: N/A

Review Area Location: State/Territory: Texas  City: NA  County/Parish/Borough: Culberson
Center Coordinates of Review Area: Latitude 31.896929°  Longitude -104.353633°

II. FINDINGS

A. Summary: Check all that apply. At least one box from the following list MUST be selected. Complete the corresponding sections/tables and summarize data sources.

☐ The review area is comprised entirely of dry land (i.e., there are no waters or water features, including wetlands, of any kind in the entire review area). Rationale: N/A

☐ There are “navigable waters of the United States” within Rivers and Harbors Act jurisdiction within the review area (complete table in Section II.B).

☐ There are “waters of the United States” within Clean Water Act jurisdiction within the review area (complete appropriate tables in Section II.C).

☐ There are waters or water features excluded from Clean Water Act jurisdiction within the review area (complete table in Section II.D).

B. Rivers and Harbors Act of 1899 Section 10 (§ 10)²

¹ Map(s)/figure(s) are attached to the AJD provided to the requestor.
² If the navigable water is not subject to the ebb and flow of the tide or included on the District’s list of Rivers and Harbors Act Section 10 navigable waters list, do NOT use this document to make the determination. The District must continue to follow the procedure outlined in 33 CFR part 329.14 to make a Rivers and Harbors Act Section 10 navigability determination.
³ A stand-alone TNW determination is completed independently of a request for an AJD. A stand-alone TNW determination is conducted for a specific segment of river or stream or other type of waterbody, such as a lake, where upstream or downstream limits or lake borders are established. A stand-alone TNW determination should be completed following applicable guidance and should NOT be documented on the AJD Form.

<td>SPA-2020-00216-LCO</td>
<td>0.1 acre(s)</td>
<td>(b)(3) Ephemeral feature, including an ephemeral stream, swale, gully, rill, or pool.</td>
<td>The waterway in question falls within the Chihuahua desert, which has a dry climate with only one rainy season in late summer; and no observations of flow were made during that timeframe. Furthermore, there are no connecting springs that contribute flow to the waterway; and the watershed receives no snowpack during the year. Given this data, the only flows that the waterway experiences are from precipitation events. Also, there is no riparian corridor within the waterway. All vegetation is upland species including, Gutierrezia sarothrae (Broom Snakeweed), Prosopis glandulosa (Honey Mesquite) and Pleuraphis mutica (Tobosa Grass). As such, the waterway crossing evaluated as part of this review is determined to be an ephemeral stream channel.</td>

III. SUPPORTING INFORMATION

A. Select/enter all resources that were used to aid in this determination and attach data/maps to this document and/or references/citations in the administrative record, as appropriate.

☒ Information submitted by, or on behalf of, the applicant/consultant: Texas Department of Transportation

This information is sufficient for purposes of this AJD.

Rationale: N/A

☐ Data sheets prepared by the Corps: Title(s) and/or date(s).

☒ Photographs: Aerial and Other: RM 652 Culver 64 11_2019; Aerial Image_RM 652 Review Area Location_12-2019

☐ Corps site visit(s) conducted on: Date(s).

☐ Previous Jurisdictional Determinations (AJDs or PJDs): ORM Number(s) and date(s).

☐ Antecedent Precipitation Tool: provide detailed discussion in Section III.B.

☐ USDA NRCS Soil Survey: Title(s) and/or date(s).

☐ USFWS NWI maps: Title(s) and/or date(s).

☒ USGS topographic maps: RM 652_Culbeson CountyCulver 64_Soil_Report

Other data sources used to aid in this determination:

<table>
<thead>
<tr>
<th>Data Source (select)</th>

<td>N/A</td>
</tr>
</tbody>
</table>

4 Some excluded waters, such as (b)(2) and (b)(4), may not be specifically identified on the AJD form unless a requestor specifically asks a Corps district to do so. Corps districts may, in case-by-case instances, choose to identify some or all of these waters within the review area.

5 Because of the broad nature of the (b)(1) exclusion and in an effort to collect data on specific types of waters that would be covered by the (b)(1) exclusion, four sub-categories of (b)(1) exclusions were administratively created for the purposes of the AJD Form. These four sub-categories are not new exclusions, but are simply administrative distinctions and remain (b)(1) exclusions as defined by the NWPR.
Data Source (select) | Name and/or date and other relevant information
---|---
USDA Sources | N/A.
NOAA Sources | N/A.
USACE Sources | N/A.
State/Local/Tribal Sources | N/A.

B. Typical year assessment(s): A study by Columbia University notes that the American Southwest is experiencing a historic “megadrought” not seen in centuries. In fact, for several western states, including New Mexico and Texas, the last twenty years ranks as the second-driest period in the past 1,200 years (A. Park. Williams, 2018). Additionally, the Antecedent Precipitation Tool indicates that this general area is drier than normal. As such, the evaluation of the proposed project site for this AJD has not been conducted during a typical year. Therefore, additional data has been obtained and reviewed to support our jurisdictional determination.

C. Additional comments to support AJD: The review area falls within the Chihuahua Desert, which has a dry climate with only one rainy season in the summer and smaller amounts of precipitation in early winter. Most of the summer rains fall between late June and early October, during the North American Monsoon when moist air from the Gulf of Mexico penetrates into the region. Furthermore, it is considered a rain shadow desert because the two main mountain ranges covering the desert, the Sierra Madre Occidental to the west and the Sierra Madre Oriental to the east, block most moisture from the Pacific Ocean and the Gulf of Mexico respectively.

Temperatures in this area range from 35 to 40° Celcius (C) (95 to 104°Fahrenheit [F]); and the average annual temperature is 24° C (75° F). The mean annual precipitation is 235 millimeters (mm) (9.3 inches [in]) with a range of approximately 150 to 400 mm (6 to16 in), and snowfall is minimal to non-existent. Soils are well drained and the water table exceeds 80 inches in depth.

Based on a review of aerial imagery and photographs of the proposed project site, the stream channel under review does not currently exhibit any flow or ponding. Furthermore, there are no connecting springs that contribute flow to the waterway; and the watershed receives no snowpack during the year. Additionally, the stream channel lacks a riparian corridor and vegetation is dominated by upland species (e.g. ). Given this data, the only flows that the waterway experiences are from precipitation events. As such, the waterway crossing evaluated as part of this review is determined to be an ephemeral stream channel.
