DIAGONAL SILL

1. The DIAGONAL SILL is always lower in the middle.
2. The rocks MUST slope down from the bank to the MID point.
3. Use the material excavated from the pool to fill the spaces between the rock.
4. Anchor the ends into the bank.
5. Try to confine the low flow to the middle 1/3 of the creek. The LOWEST POINT may be placed at any point to move the current from side to side.
6. Amour the banks with rip-rap where needed to protect banks.
